

Proof of Concept (POC) Document

Temporary / Reusable Email Solution for CIAM Regression Testing

1. Objective

The objective of this POC is to evaluate and implement a temporary or reusable email solution for CIAM (Customer Identity and Access Management) regression testing.

The solution should support:

- Receiving OTP emails
 - Verifying email notifications
 - Automated inbox access
 - Reusable email generation
 - Integration with automation frameworks
 - Support for long-duration inbox retention (1 week to 1 month)
-

2. Problem Statement

Currently, CIAM regression testing requires email verification and OTP validation during execution.

Challenges faced:

- Manual OTP retrieval
- Temporary email expiration
- Lack of reusable inboxes
- Difficult integration with automation frameworks
- Instability in regression execution

The goal is to automate email and OTP handling to improve regression efficiency and reduce manual intervention.
